

LYNCH ESTATE ELEMENTS

PLANTERS AND URNS

URNOLOGY

- Available material options include cast stone, aluminum and lead.
- All materials listed above can be left out of doors all year, in all climates.
- Integrating irrigation is very useful.
- Some urns have optional lids for use during winter months.
- Create additional interest by placing urns and planters on pedestals.

URN STYLE GUIDE

The above “Urnology”, as Kenneth Lynch coined it, is helpful when considering what shape is appropriate to best suit your garden design. The illustration above outlines the various classic urn shapes and the distinct parts of an urn. Urns of various shapes, profiles, and materials can coexist beautifully and provide visual interest throughout your garden.

With the durability of cast stone it is possible to have very large garden urns that will handle the pressures of soil and water weight. Many of our cast stone urns are based on original designs which were carved in natural Italian limestone. The details on naturally carved stone is reproduced in our hand laid latex molds.

Our founder Kenneth Lynch had the vision and intention of making the beauty of such carved pieces more accessible to the garden ornament market. The bonus to the cast stone material is that it is well suited to the harsher climates during winter months. Lead is a unique material in that it is cast in sections from molds and then welded together to make a cohesive whole. The urn designs in lead are generally smaller than those in cast stone, but often the detailing is very fine, reproducing intricate ornamentation.
